

## 2020 North Country 1st Cutting Alfalfa-Grass Quality Monitor

### June 1, 2020 FINAL Report

#### Check individual fields!

Notice the differences among these monitored fields. (Open circles show previous week's height for comparison.)

It is important to get out and measure alfalfa heights in your own fields to help judge rate of growth and maturity for best timing of 1st cutting.

Refer to table on page 2 for detailed information on each site.

Points on the graph with 0" alfalfa height have been mowed.

The North Country 1st Cutting Forage Quality Monitoring Program is made possible by Cornell Cooperative Extension. Data collection by Lindsay Ferlito, Mike Hunter, Mellissa Spence, Joe Lawrence, Jessica Prosper, Eric Bever, Jonathan Krauss, Csey Havekes and Kitty O'Neil.

**Goal % NDF** - NDF (Neutral Detergent Fiber) content is the best predictor of forage quality for lactating dairy cows. NDF content of standing first cutting alfalfa and grasses is easily predicted by alfalfa height. The relationship between NDF content in an alfalfa-grass mix and alfalfa height only works for first cutting. Second and 3rd cuttings should simply be taken according to the calendar - at 28 to 35 day intervals.

100% Grass - Goal NDF (on a dry matter basis) is 50% (target range 48-55). Tallest alfalfa height will be 14-16 inches.

100% Alfalfa - Goal NDF is 40% (target range 39-43). Tallest alfalfa height will be 28-30 inches.

Mixed stand - for a 50:50 alfalfa:grass stand, the goal NDF is 43%. Tallest alfalfa height will be 22-23 inches.

Begin harvest early enough so that most of your crop is harvested within the "ideal" range. Typically NDF increases about 0.5 to 0.7/day for alfalfa and about 0.8 to 1.2/day for grass. Expect the lower end of that range in cooler weather and the higher end in warm.

#### **Weekly Tips and Observations**

- Several fields across the region were mowed this past week to capture high quality forage (fields with 0" alfalfa in the graph above). Alfalfa blooms were not reported yet in any fields.
- Fields with 30% grass or more are all at or beyond peak quality according to our data above. Grasses are nearly all headed now and have declined in quality.
- Alfalfa growth progressed about 6.6" with warm temperatures during the past week, but continued to remain slightly behind 2018 and 2019 averages for this time of the year. Alfalfa averaged 24.6" across NNY this week, compared with about 30" in 2018 and 25" in 2019. - Apply N or manure to grass fields immediately after 1st cutting. It's much too late to help 1st cutting now. What about K on alfalfa? Read guidance [here](#).

## 2020 North Country 1st Cutting Alfalfa-Grass Quality Monitor

County	Town/Field	Elevation (feet)	Soil		Alfalfa Height, inches						
			Type	% Grass	4-May	11-May	18-May	26-May	1-Jun	8-Jun	15-Jun
